Petition for Rulemaking

I. Introduction

The undersigned submit this petition to request that the Food Safety and Inspection Service (FSIS) amend the ante-mortem inspection regulations to prohibit the slaughter of non-ambulatory disabled (NAD) pigs.¹ Specifically, Petitioners request that FSIS amend 9 C.F.R. § 309.3 by adding a provision: “(f) Non-ambulatory disabled pigs that are offered for slaughter must be condemned and humanely euthanized in accordance with § 309.13.”

FSIS should initiate this rulemaking to improve food safety, animal handling, and inspector efficiency at slaughter establishments. In March 2009, FSIS promulgated a rule that banned the slaughter of NAD cattle in order “to better ensure effective implementation of inspection and humane handling requirements at official establishments.”² Then, in March 2013, FSIS granted a petition filed by the Humane Society of the United States (HSUS) to prohibit the slaughter of NAD veal calves to “better ensure humane handling requirements established pursuant to 21 U.S.C. 603(b) are satisfied, and to ensure the effective implementation of ante-mortem inspection pursuant to 21 U.S.C. 603(a) of the Federal Meat Inspection Act.”³

The same logic offered by USDA in making these previous two important decisions also requires the condemnation and prompt euthanasia of NAD pigs.⁴

First, USDA’s statutory food safety mandate requires the condemnation of NAD pigs. As FSIS has acknowledged, reduction of salmonella prevalence will “help [slaughter establishments] better comply with the relevant regulatory requirements (9 CFR 310.7, 310.10, 310.11, 310.12, 310.18, 310.25, Part 416, and Part 417).”⁵ And the agency has noted specifically that “lairage is the most cost-effective stage to prevent cross-contamination that leads to rapid infection.”⁶

A European Food Safety Authority Scientific Opinion links long holding times and fecal contamination at pig slaughter establishments to *Salmonella* spp. and *Yersinia enterocolitica* infection.⁷ NAD pigs are prone to both hazards: they are held longer than other pigs and exposed to more fecal matter because they cannot rise from the floor of dirty holding pens. Other studies have found that most NAD pigs are actively infected with H1N1 swine influenza,⁸ that NAD

¹ “Non-ambulatory disabled livestock are livestock that cannot rise from a recumbent position or that cannot walk, including, but not limited to, those with broken appendages, severed tendons or ligaments, nerve paralysis, fractured vertebral column, or metabolic condition.” 9 CFR § 309.2(b).

⁸ Attachment 3, Mhairi A. Sutherland, et al., *Health of non-ambulatory, non-injured pigs at processing*, 116 LIVESTOCK SCI. 237–245 (2008).

pigs present symptoms of *Listeria monocytogenes* and other infections, and that NAD pigs are 16 times more likely than ambulatory pigs to harbor antibiotic-resistant *Campylobacter*.⁹ Condemning NAD pigs will thus reduce the risk of diseased pigs entering the food supply.

Second, USDA statutory animal handling mandate also requires the prompt euthanasia of NAD pigs. Prompt euthanasia would end the fiscal incentive for establishments to inhumanely force NAD pigs to rise¹⁰ and end the incentive for producers to send to slaughter “old, weak, emaciated sows . . . likely to become downers.”¹¹ It would also create an incentive for establishments to improve animal handling, since improved handling generates up to 17 times fewer NAD pigs than aggressive handling does.¹² And it would improve handling throughout slaughter establishments because “[m]aintaining an adequate level of animal welfare at the plant level is impossible if the pigs are too weak to walk through the yards.”¹³

Third, in addition to the fact that the slaughter of NAD pigs leads to higher levels of adulteration and cruelty, the current regime taxes inspectors in a way that decreases agency efficiency with regard to all tasks assigned to inspectors.¹⁴ FSIS cited this issue in both its decision to ban the slaughter of NAD cattle¹⁵ and in its decision to do the same for calves.¹⁶ As FSIS deals with inspector cutbacks and a move toward greater self-regulation by slaughterhouses, a rule to ban the slaughter of NAD pigs will best ensure that inspector attention is not diverted to an issue that, even if time and multitude of tasks competing for an inspector’s time and attention were not an issue, “may be impossible to ascertain.”¹⁷

II. Interests of Petitioners

Petitioner the American Society for the Prevention of Cruelty to Animals (ASPCA) has worked since 1866 to stop the cruelties committed upon animals used for food. In the late 1800s, early ASPCA agents inspected New York City’s stockyards and slaughterhouses, while ASPCA founder Henry Bergh pursued legislation to ensure that animals raised for human consumption

⁹ Attachment 4, M.E. Schuppers, *Clinical herd health, farm management and antimicrobial resistance in campylobacter coli on finishing pig farms in Switzerland*, 69 PREV. VET. MED. 189–202 (2005).

¹⁰ The most recent available analysis estimates that if an establishment can force a pig to rise before ante-mortem inspection it is worth \$126. By contrast, if an establishment has to classify the pig as NAD, it is worth \$88, and if it is ultimately condemned it is worth nothing. Attachment 5, M. J. Ritter, et al, *Review: Transport losses in market weight pigs: I. A review of definitions, incidence, and economic impact*, 25 PROF. ANIM. SCIENTIST 404–415 (2009), available at <http://pas.fass.org/content/25/4/404.full.pdf+html>. BF COMMENT: This says to me that the difference between condemnation and non-condemnation is at least \$88; I did make this change in the few places where the issue is discussed. Please let me know if I’ve missed anything.

were handled humanely. Today, on behalf of its 2.5 million supporters, the ASPCA continues its efforts to prevent the suffering of animals raised for food.

Petitioner ALDF is a national nonprofit organization that works to protect the lives and advance the interests of animals through the legal system. ALDF has spent over three decades working on issues involving animals and the law, with a focus on assisting agencies, courts, and legislatures in carrying out public policy against animal cruelty and advancing the protection of the interests of animals and consumers under the law. Based in Cotati, California, ALDF represents over 110,000 members, is supported by hundreds of dedicated pro bono attorneys, and supports 177 student ALDF chapters in law schools throughout the United States. ALDF has long been involved in the protection of animals used and sold in commercial enterprises, with a particular focus on the cruel treatment and intensive confinement of animals used for food.

Petitioner the Animal Welfare Institute (AWI), a non-profit charitable organization, has been alleviating the suffering inflicted on animals by people since its founding in 1951. AWI aims to improve the welfare of animals used in agriculture through engagement with policymakers, scientists, industry, non-governmental organizations, farmers, veterinarians, teachers, and the public. Specifically, AWI seeks to abolish factory farms, support high-welfare family farms, achieve humane slaughter, and improve transport conditions for all animals raised for food. The organization monitors enforcement of U.S. humane slaughter laws and lobbies for stronger regulation and increased enforcement. It also regularly comments on proposed changes to international standards for the welfare of animals at slaughter. Headquartered in Washington, DC, AWI has members and supporters throughout the United States.

Compassion in World Farming (CIWF) was founded in 1967 in England by a British farmer who became horrified by the development of intensive factory farming. Over 40 years ago he decided to make a difference and take a stand against this farming system. In his lifetime, Peter Roberts saw the demise of veal crates and gestation crates in the UK, and in Europe achieved recognition that animals are sentient beings and secured a ban on the barren battery cage and gestation crates for sows (except for the period up to four weeks into pregnancy). Today, CIWF campaigns on a global level to end all cruel factory farming practices. The organization believes that the biggest cause of cruelty on the planet deserves a focused, specialized approach – so it only works on farm animal welfare. CIWF's U.S. office is based in Atlanta, Georgia.

Petitioner Compassion Over Killing (COK) is a national nonprofit animal advocacy organization working to eliminate cruelty to animals used in agriculture, including pigs, since 1995. COK seeks to educate the public about the cruel practices utilized by industrial animal agriculture through investigations, legal advocacy, and outreach campaigns. Many of COK's more than 45,000 supporters are concerned about the treatment of animals when purchasing animal products, and support measures that would help eliminate the inhumane handling of injured and disabled pigs.

Launched in 2007, Farm Forward is a nonprofit advocacy and consulting group at the forefront of pragmatic efforts to transform the way our nation eats and farms. Our vision is encapsulated in the critically acclaimed international bestseller *Eating Animals* by Farm Forward

Board Member Jonathan Safran Foer, and our executive staff and board have been working on behalf of farmed animals since the early 1990s. This accumulated expertise informs Farm Forward's unique role as the first centrist organization where disparate interests opposed to the abuse of animals on factory farms can unite in coordinated and effective ways.

Petitioner Farm Sanctuary has worked since 1986 to expose and stop cruel practices of animal agriculture through research and investigations, legal and institutional reforms, public awareness projects, youth education, and direct rescue and sanctuary efforts. Farm Sanctuary's policy efforts have led to laws and regulations that protect farm animals from some of the worst abuses of industrial farming. Farm Sanctuary's three shelters in New York and California provide lifelong care for more than 1,000 abused and neglected farm animals, who have become ambassadors for farm animals everywhere by educating visitors about who farm animals are and how they suffer in modern farming.

Petitioner Mercy For Animals (MFA) is a national non-profit animal protection organization dedicated to preventing cruelty to farmed animals and promoting compassionate food choices and policies. Through its animal cruelty investigations, legal advocacy, corporate outreach, and consumer education initiatives, MFA serves as a voice for the billions of farmed animals who are raised and killed for food each year in this country. MFA has a long history of undercover investigations and legal advocacy efforts that have led to increased legal protections for farmed animals and enforcement of existing animal cruelty laws.

III. Action Requested

Pursuant to the FSIS petition regulations¹⁸ and the Administrative Procedure Act,¹⁹ the undersigned submit this petition for rulemaking under the Humane Methods of Slaughter Act (HMSA), which requires that FSIS take regulatory action to prevent inhumane handling in the slaughter process, and under the Federal Meat Inspection Act (FMIA), which requires that FSIS prevent the sale of meat unfit for human consumption. Specifically, Petitioners request that FSIS amend 9 C.F.R. § 309.3 by adding a provision:

Section 309.3 Dead, dying, disabled, or diseased and similar livestock.

(f) Non-ambulatory disabled pigs that are offered for slaughter must be condemned and humanely euthanized in accordance with § 309.13.

Additionally, Petitioners request that FSIS amend its directives on ante-mortem inspection,²⁰ humane handling and slaughter of livestock,²¹ and any other relevant topics, to clarify that all pigs non-ambulatory at ante-mortem inspection, and all pigs that become non-ambulatory after passing ante-mortem inspection, must be promptly and humanely euthanized.

¹⁸ 9 C.F.R. § 392.

¹⁹ 5 U.S.C. 553(e).

²⁰ Ante-Mortem Livestock Inspection, FSIS Directive 6100.1, Rev. 1 (Apr. 11, 2011).

²¹ Humane Handling and Slaughter of Livestock, FSIS Directive 6900.2, Rev. 2 (Aug. 15, 2011).

IV. Legal Background

A. The Humane Methods of Slaughter Act

Congress passed HMSA to “establish as a national policy that livestock should be slaughtered and handled in connection with slaughter only by the ‘most humane practicable methods.’”²² The Act authorizes USDA to “designate methods . . . of handling in connection with slaughter which with respect to each species of livestock, conform to [that] policy.”²³ HMSA is incorporated by reference into the Federal Meat Inspection Act (FMIA), which instructs USDA to appoint inspectors to enforce humane handling regulations at slaughter establishments.²⁴ The 1978 amendments to the Act direct USDA to refuse to inspect at a slaughter establishment if animals “have been slaughtered or handled in connection with slaughter at such establishment by any method not in accordance with [HMSA].”²⁵ FSIS regulations govern all aspects of handling animals at slaughter establishments.²⁶ In line with Congress’ intent, these regulations apply from the moment “a vehicle carrying livestock enters an official slaughter establishment’s premises” until slaughter.²⁷

B. The Federal Meat Inspection Act

FMIA authorizes USDA to conduct ante-mortem and post-mortem inspections to ensure that adulterated meat does not enter the human food supply.²⁸ FMIA directs USDA to inspect animals “before they shall be allowed to enter into any slaughtering . . . establishment” and to “set apart and slaughter[] separately” animals that “show symptoms of disease.”²⁹ FMIA grants USDA broad authority to “make such rules and regulations as are necessary for the efficient execution of the provisions of [FMIA].”³⁰ Under these regulations, FSIS inspectors designate all animals presented for slaughter as U.S. Condemned, U.S. Suspect, or fit for slaughter.³¹ These inspectors are meant to document all humane handling violations with a non-compliance record, and may respond to food safety and humane handling violations with a “regulatory control action,” “withholding action,” or “suspension.”³² Additionally, criminal enforcement is available under section 676; thus, inhumane slaughter could result in “imprisonment for not more than one

²² Attachment 9, H.R. Report No. 85-706, at 4 (1957). *See also* 7 U.S.C. 1902 (“No method of slaughtering or handling in connection with slaughtering shall be deemed to comply with the public policy of the United States unless it is humane”).

²³ 7 U.S.C. 1904(b).

²⁴ 21 U.S.C. 603(b).

²⁶ *See* 9 C.F.R. § 313. *See also* provisions of 9 C.F.R. §§ 301, 304, 305, 313, 327, 335, 390, 391.

²⁷ 44 Fed. Reg. 68,811 (*quoting* S. Comm. Rep. No. 95-1059, at 4 (1978) (“It is the committee’s intent that handling in connection with slaughter be interpreted by the Secretary to begin at the time livestock come into the custody of the slaughtering establishment, up to and including the moment of slaughter.”)).

²⁸ 21 U.S.C. §§ 603, 604, 606. Section 601(m) of the FMIA defines “adulterated” to include: “any carcass, part thereof, meat or meat food product . . . (m)(1) if it bears or contains any poisonous or deleterious substance that may render it injurious to health . . . (m)(3) if it consists in whole or in part of any filthy, putrid, or decomposed substance or is for any other reason unsound, unhealthful, unwholesome, or otherwise unfit for human food.”

²⁹ 21 U.S.C. 603(a).

³⁰ 21 U.S.C. 621.

³¹ 9 C.F.R. §§ 309.2, 309.3.

³² *See* 9 C.F.R. § 313.50 (“When an inspector observes an incident of inhumane slaughter or handling in connection with slaughter, he/she shall inform the establishment operator of the incident and request that the operator take the necessary steps to prevent a recurrence.”). A “regulatory control action” is “the retention of product, rejection of equipment or facilities, slowing or stopping of lines, or refusal to allow the processing of specifically identified product.” *Id.* § 500.1(a). A “withholding action” is “the refusal to allow the marks of inspection to be applied to products.” *Id.* § 500.1(b). A “suspension” is “an interruption in the assignment of program employees to all or part of an establishment.” *Id.* § 500.1(c).

year, or a fine of not more than \$1,000, or both.”³³ And if the violation “involves intent to defraud, or any distribution or attempted distribution of an article that is adulterated ... such person, firm, or corporation shall be subject to imprisonment for not more than three years or a fine of not more than \$10,000, or both...”³⁴

C. Regulations Governing Non-Ambulatory Disabled Livestock

FSIS regulations have split procedures for NAD livestock. Inspectors must condemn NAD cattle and ensure that they are promptly euthanized.³⁵ But inspectors need only identify other “seriously crippled animals and non-ambulatory disabled livestock” – including pigs – as U.S. Suspects that “shall be set apart and shall be slaughtered separately from other livestock.”³⁶ Establishments are meant to move NAD pigs “on equipment suitable for such purposes,”³⁷ though FSIS directives authorize the use of “bobcat-type vehicles.”³⁸ Establishments may then slaughter NAD pigs, whose meat enters the food supply after post-mortem inspection, or hold them in covered pens to see if they regain the ability to walk.³⁹ There is no limit to how long U.S. Suspects can be held for, though the establishment must feed an animal held for over 24 hours.⁴⁰

V. Factual Background

A. Food Safety and Non-Ambulatory Disabled Pigs

1. Salmonella Spp. and Yersinia Enterocolitica Contamination

The European Food Safety Authority recently conducted a comprehensive risk assessment of the biological and chemical public health hazards associated with swine slaughter.⁴¹ The resulting Scientific Opinion identifies *Salmonella* spp. as the most severe biological hazard in swine slaughter, and *Y. enterocolitica* as one of the four most potent hazards.⁴² The Scientific Opinion also identifies ante-mortem contamination as the primary source of *Salmonella* spp. carcass contamination: “currently, about 70% of all carcass contamination results from the animals themselves being carriers.”⁴³ And the Scientific Opinion finds that animals are more likely to become carriers the longer they are held in lairage.⁴⁴ The Scientific Opinion concludes that “as indicated in previous sections, keeping the pig transport-lairaging period as short as possible, including avoiding lairaging altogether . . . may be beneficial in terms of reducing associated cross-contamination of pigs with *Salmonella* spp. and *Y. enterocolitica*.”⁴⁵

The Scientific Opinion is consistent with other studies that have shown long lairage times increase the risk of *Salmonella* contamination; indeed, FSIS recognizes this issue. In its

⁴³ *Id.* at 51.

⁴⁴ *Id.* at 50.

⁴⁵ *Id.* at 61.

December 2013 *Compliance Guideline for Controlling Salmonella in Market Hogs*, the agency noted that “the lairage is the most cost-effective stage to prevent cross-contamination that leads to rapid infection (Vander Gaag, 2004).”⁴⁶ In a study by Iowa State veterinary professor Scott Hurd, et al., pigs were placed in a simulated lairage environment – a holding pen with a slurry of water and *Salmonella*-contaminated feces on the floor. After just 2 hours, 80 percent of pigs contracted *Salmonella Typhimurium*, and all did after 6 hours of lairage.⁴⁷ The authors concluded, “Intervention at this [lairage] step of the production process may have a major impact on the safety of pork products.”⁴⁸ In a later report, the same authors found that pigs were seven times more likely to acquire *Salmonella enterica* during transport and lairage than they were to acquire it on the farm.⁴⁹ They concluded, “The fact that 100% of pigs were infected after six hours of exposure identifies the need to avoid long lairage times.”⁵⁰ Notably, in these trials, all of the pigs were able to stand, and these were controlled conditions.

A French study quantified the effect of increased lairage times on *Salmonella* infection. The researchers found that pigs held for 3-6 hours in lairage are three times more likely to contract *Salmonella* than those held for fewer than three hours.⁵¹ Pigs held for over six hours are nine times more likely to catch *Salmonella*.⁵² The authors concluded, “The effect of the time spent in lairage on *Salmonella* caecal contamination was identified as a crucial risk factor . . . The longer the time spent by the pigs in lairage, the higher was the risk for caecal contamination . . . At the slaughter-house, control measures should be implemented to reduce the time spent in lairage before slaughtering.”⁵³

NAD pigs endure more time in lairage than other pigs. There is no limit to how long a slaughter establishment can hold a NAD pig.⁵⁴ But establishments have a strong incentive to hold NAD pigs for as long as it takes them to rise, since a NAD pig that rises is worth at least \$38 more than a pig that does not rise.⁵⁵ Slaughter establishments will also often wait until the end of the slaughter shift to slaughter NAD pigs separately—and the standard slaughter shift lasts 8 hours.⁵⁶ Based on the studies cited above, this increased lairage time will make NAD pigs at least 3-9 times more likely to contract *Salmonella*.

The Scientific Opinion also links *Salmonella* spp. and *Y. enterocolitica* to slaughtering dirty pigs, especially pigs covered in fecal matter. The Scientific Opinion recommends “ensuring through current *ante-mortem* inspection that only visually clean pigs . . . without observable abnormalities enter the routine slaughtering process.”⁵⁷ Clean pigs are less likely to be

⁵⁷ Attachment 1 at 69.

contaminated than dirty pigs because “microbial loads on skins of clean incoming pigs are reduced.”⁵⁸ The Scientific Opinion further notes that “in case of pig batches from *Salmonella*- and *Y. enterocolitica*-positive farms being presented for slaughter, it could be assumed that the dirtier animals are with faecal material, the higher risk exists of cross-contamination of the slaughterline environment including the carcasses.”⁵⁹

NAD pigs are often dirty with fecal matter because NAD pigs cannot rise from the floor of slurry-filled holding pens. As *Meat and Poultry* magazine explains, “Lame animals spend more time lying down, which increases the likelihood they will be contaminated with fecal matter.”⁶⁰ Swine fecal matter has been found to include the bacterial pathogens *Bacillus anthracis*, *Brucella* spp., *Campylobacter* spp., *Chlamydia* spp., [enteropathogenic] *Escherichia coli*, *Leptospira* spp., *Listeria monocytogenes*, *Mycobacterium* spp., *Salmonella* spp., and *Yersinia* spp.⁶¹ As a result, NAD pigs are 16 times more likely to harbor antibiotic-resistant *Campylobacter* than ambulatory pigs.⁶²

2. H1N1 Swine Influenza

Non-ambulatory pigs are more likely to carry swine influenza subtypes H1N1 and H3N2 than other pigs. A Pork Industry Institute-funded study compared NAD pigs and ambulatory pigs at slaughter establishments accounting for almost a fifth of U.S. pork production.⁶³ The researchers found that fully 53.8% of NAD pigs were actively infected with H1N1 and 51.9% were actively infected with H3N2.⁶⁴ A genetic analysis of the 2009 H1N1 pandemic revealed that six of the eight viral gene segments came from a hybrid swine/human/avian flu virus that was prevalent in the U.S. pork industry.⁶⁵ The Centers for Disease Control and Prevention estimates that the H1N1 pandemic sickened 60.8 million Americans, hospitalized 274,304, and killed 12,469.⁶⁶

3. Other Pathogens Associated with NAD Pigs

Lameness – an abnormality common to NAD pigs – is a clinical symptom of several bacterial, prion, and viral diseases. These diseases include:

- *Listeria monocytogenes*, a bacterial infection that causes *Listeriosis*, which contributes to an estimated 28% of U.S. foodborne illness deaths,⁶⁷ presents as lameness in pigs.⁶⁸

⁶⁸ Attachment 18, H. Scott Hurd et al. *Swine health impact on carcass contamination and human foodborne risk*, 143 PUBLIC HEALTH REPORTS 343-351 (2008).

- *Erysipelothrix rhusiopathiae*, a bacterial infection that can cause human septic arthritis, endocarditis, and meningitis, presents as lameness in pigs.⁶⁹
- *Brucellosis*, one of the most common zoonotic diseases, presents as lameness in pigs.⁷⁰
- *Porcine spongiform encephalopathy*, the pig equivalent to “mad cow disease,” with links to deadly Creutzfeldt-Jakob disease, presents as “persistent recumbency with difficulty in rising.”⁷¹
- *Arcanobacterium and Trueperella* (formerly known as *Actinomyces pyogenes*), bacterial infections that can cause human joint and bone infections, pneumonia, and fatal endocarditis, present as lameness in pigs.⁷²
- *Streptococcus suis* and *Streptococcus equisimilis*, both potent occupational zoonoses for workers in the pork industry, present as lameness in pigs.⁷³

The re-inspection of NAD pigs before slaughter is unlikely to spot these diseases associated with lameness. Former FSIS senior staff veterinarian Linda Detwiler notes that the underlying cause of a non-ambulatory condition “may be impossible to ascertain.”⁷⁴ Bovine veterinarian Jim Reynolds of the University of California’s School of Veterinary Medicine explains that even trained veterinarians find it nearly impossible to determine why a NAD animal cannot rise.⁷⁵ And FSIS notes, “the underlying reason for an animal’s non-ambulatory condition cannot always be accurately ascertained when these animals are presented for slaughter.”⁷⁶

4. “Fatigued” Pigs: A False Distinction Invented by Industry.

The industry’s response that most NAD pigs are merely “fatigued”⁷⁷ is both wrong and irrelevant. The industry defines “fatigued” pigs as all non-ambulatory pigs lacking “obvious injury, trauma, or disease.”⁷⁸ First, this is a baseless distinction; pigs who are too sick or injured to stand are suffering, and they are far more likely to harbor disease than pigs who can walk, regardless of whether they may eventually stand. Second, both “fatigue” and other forms of NAD are caused by ill treatment, which violates the HMSA, as will be discussed further in the next section.

Additionally, most “fatigued” pigs display less-obvious symptoms of illness, internal injuries, or severe stress: skin discoloration (77%), muscle tremors (83%), and lameness

⁷⁸ *Id.* (dividing all non-ambulatory pigs into two categories: “injured” and “fatigued”).

(100%).⁷⁹ All three of these symptoms could indicate the presence of severe illnesses—for instance, the only visible symptom of *Porcine spongiform encephalopathy* (Mad Pig Disease) can be “persistent recumbency with difficulty in rising.”⁸⁰

Moreover, even “fatigued” pigs who are not ill when they enter holding pens are more likely to be ill when they leave them. The Scientific Opinion shows that any additional lairage time increases the risk that pigs will contract *Salmonella* spp. and *Y. enterocolitica*. “Fatigued” pigs may actually be held in lairage even longer than “injured” pigs because they are more likely to regain the ability to walk. And while they are in lairage, “fatigued” pigs come into as much contact with fecal matter on the floor of dirty holding pens as all NAD pigs. As a result, “fatigued” pigs will harbor *Campylobacter* and other pathogens at significantly higher rates than other pigs.⁸¹

B. Inhumane Handling and NAD Pigs

1. FSIS’ Evolving Position on NAD Livestock

FSIS has increasingly recognized that allowing the slaughter of NAD livestock encourages inhumane handling. In 2009, FSIS required that all NAD mature cattle be promptly euthanized.⁸² FSIS explained that allowing the slaughter of NAD cattle that rise “may have encouraged . . . livestock producers to hold ill or injured cattle from slaughter longer in an attempt to allow them to sufficiently recover to pass the initial ante-mortem inspection before collapsing.”⁸³ FSIS further explained that the practice “may have created an incentive for establishments to inhumanely force these animals to rise.”⁸⁴

Last year, FSIS granted a Humane Society of the United States (HSUS) petition requesting the prompt euthanasia of NAD veal calves offered for slaughter.⁸⁵ FSIS explained that the current policy allowing NAD veal calves to be slaughtered after re-inspection “may create an incentive for establishments to inhumanely force non-ambulatory veal calves to rise and for veal calf producers to send weakened calves to slaughter.”⁸⁶ FSIS stated that its new policy will “improve the Agency’s inspection efficiency” and “improve compliance with the HMSA and the humane slaughter implementing regulations.”⁸⁷

FSIS’ evolving position is consistent with the Agricultural Marketing Service’s (AMS) humane handling standards. AMS’ contracts prohibit the purchase of meat from NAD animals, including NAD pigs. AMS explains: “The logic behind the prohibition of non-ambulatory, disabled livestock was to ensure the humane treatment of animals by their being managed and handled in a manner that would enable them to walk into the facility’s stunning area.”⁸⁸ In 2008,

⁸⁸ Attachment 26, Lloyd Day, Administrator, USDA Agriculture Marketing Service, Informational Memorandum for the Undersecretary, at 2 (May 15, 2008) (“It is important to note that the prohibition of non-ambulatory, disabled livestock from AMS meat purchases was implemented solely to ensure the humane treatment of animals.”).

AMS strengthened this policy – a move that an AMS spokesperson said was “directly aimed at ensuring there is not a repeat of the conditions animals were subjected to at Hallmark/Westland.”⁸⁹

FSIS’ evolving position is also consistent with Congress’ actions. In 2001, the Senate Committee on Agriculture, Nutrition, and Forestry was considering an amendment to the Farm Bill that would ban the slaughter of downed livestock. In its report on the issue, the Committee found “that the transportation and marketing of downed livestock can be inhumane, and that meat from downed livestock may involve increased food safety risks.”⁹⁰ Congress subsequently directed USDA to report on the scope, causes, and humane handling implications of slaughtering NAD livestock, and consider “regulations to provide for the humane treatment, handling and disposition of non-ambulatory livestock.”⁹¹ Since then, FSIS has repeatedly stated that it plans to “evaluate measures that may be necessary to ensure the humane handling of other non-ambulatory disabled livestock species.”⁹²

2. How Inhumane Handling Causes Pigs to Become Non-Ambulatory

Industry studies show that inhumane handling causes pigs to become non-ambulatory. The American Meat Institute cites data showing that 34% of pigs become fatigued when subject to “aggressive handling with hot shots,” 15% do when subject to “aggressive handling with paddles,” and just 2% do when subject to “gentle handling with paddles.”⁹³ An Elanco Animal Health-funded study found that pigs held in small pens and not presorted are twice as likely to become non-ambulatory as pigs presorted and held in large pens.⁹⁴ Another study shows that when workers use electrical prods on over 60% of pigs (instead of on fewer than 10%), four times more pigs become non-ambulatory.⁹⁵

Inhumane production practices also cause pigs to become non-ambulatory. Dr. Temple Grandin observes, “Sow condition is declining especially on the largest farms . . . Slaughter plant managers have reported that the condition of sows from some farms has become worse.”⁹⁶ She attributes this deterioration to abuse of the growth stimulant Paylean,⁹⁷ and producers allowing “old, weak, emaciated sows . . . to deteriorate into a weakened condition . . . likely to become

⁹⁰ The Committee recommended passage of a provision to require the immediate euthanasia or veterinary care of all NAD livestock. Attachment 28, Senate Committee on Agriculture, Nutrition, and Forestry, S. Report 107-117, to accompany S. 1731 (Dec. 7, 2001). The Senate passed this provision as part of the 2002 Farm Bill, but it was removed in conference.

⁹¹ Congress requested that USDA “investigate and submit to Congress a report on — (1) the scope of non-ambulatory livestock; (2) the causes that render livestock non-ambulatory; (3) the humane treatment of live non-ambulatory livestock; and (4) the extent to which non-ambulatory livestock may present handling and disposition problems for stockyards, market agencies, and dealers.” Congress also requested, “Based on the findings of the report, if the Secretary determines it necessary, the Secretary shall promulgate regulations to provide for the humane treatment, handling and disposition of non-ambulatory livestock.” 7 U.S.C. § 1907(b).

downers.”⁹⁸ She further notes that producers have bred pigs for fast growth, not good welfare: “Modern hybrid pigs—selected for rapid growth, high leanness and extreme muscularity—are often prone to stress that causes the pig to become nonambulatory, to die during transport and/or preslaughter handling.”⁹⁹

Similarly, inhumane transportation practices cause pigs to become non-ambulatory. As early as 1961, USDA observed that more pigs die when trucked long distances.¹⁰⁰ Since then, the industry has only increased long-distance trucking, often trucking pigs from production facilities in Nebraska and Texas to California for slaughter. Transporters also continue to overcrowd pigs in trucks, despite research showing that pigs given one more square foot of space are seven times less likely to become non-ambulatory.¹⁰¹

These practices continue because there are weak financial incentives to keep pigs ambulatory. Current regulations allow establishments to use electrical prods to force NAD pigs to rise before their ante-mortem inspection,¹⁰² or to hold them indefinitely until they rise after their inspection.¹⁰³ In either case, the establishment gains the full slaughter value of the pig.¹⁰⁴ And even if the pig remains non-ambulatory, it is still worth roughly 70% the value of an ambulatory pig. (By contrast, if establishments had to condemn NAD pigs they would lose money on each pig they caused to become non-ambulatory, due to labor, segregation, and disposal costs.¹⁰⁵) As a result, the prevalence of non-ambulatory pigs has tripled since 1933-34, when just 0.16% of pigs arrived at slaughter establishments non-ambulatory; today, an estimated 0.44% do.¹⁰⁶

3. The Inhumane Handling of NAD Pigs

FSIS records show that some establishments continue to inhumanely handle NAD pigs. Since FSIS began publishing statistics in 2009, the number of non-compliance records for humane handling has increased annually.¹⁰⁷ Although the number of inspection procedures performed has also increased, an Office of the Inspector General (OIG) report suggests these

¹⁰⁴ Attachment 6.

¹⁰⁵ *Id.* at 409.

¹⁰⁶ *Id.*

¹⁰⁷ Data is only available from 2009 until the end of Q2 2013. FSIS inspectors issued 504 humane handling non-compliance records from Q3 2009 to Q2 2010; 572 from Q3 2010 to Q2 2011; 605 from Q3 2011 to Q2 2012; and 649 from Q3 2012 to Q3 2013. See FSIS Humane Handling Quarterly Enforcement Reports, available at <http://www.fsis.usda.gov/wps/portal/fsis/topics/regulatory-compliance/regulatory-enforcement/quarterly-enforcement-reports>.

records still underreport the scale of humane handling violations.¹⁰⁸ In the less than 30 minutes that OIG observed the stunning process at five slaughter establishments, OIG witnessed several egregious violations of HMSA that went unreported by FSIS inspectors.¹⁰⁹ OIG also found that establishments were seldom suspended for egregious humane handling violations of NAD pigs. For example,

[A]n inspector observed a plant employee in a skid loader (similar to a fork lift) attempting to move a non-ambulatory hog. The employee repeatedly drove into the live hog, pushing it with the skid loader, attempting to lift the hog into the loader bucket. On one attempt, the operator was able to lift the back half of the hog into the loader, but the load was so imbalanced that the hog fell out of the loader and onto the concrete floor. The inspector only issued an NR.¹¹⁰

The OIG report is consistent with other evidence of inadequate FSIS supervision of the handling of NAD pigs, which may be a result of understaffing and underfunding, as well as too many agency tasks and priorities. Whatever the cause, the situation is dire, as indicated by a 2010 Government Accountability Office audit that found that inspectors did not take consistent enforcement actions when faced with humane handling violations.¹¹¹ That year, FSIS inspector Dr. Dean Wyatt testified before Congress that slaughter establishments screened off unloading areas so that FSIS could not document humane handling violations.¹¹² He also testified that he had repeatedly been told not to prepare noncompliance records or take other enforcement actions, even after witnessing workers punching a NAD pig in the face and nose 8-12 times.¹¹³

But FSIS records still present a snapshot of the inhumane handling of NAD pigs at slaughter establishments. At Carolina Pride Foods on January, 9, 2013, FSIS inspectors observed a pig become non-ambulatory as workers were trying to force her down an alleyway.¹¹⁴ After the pig fell to the ground, the workers continued to drive another pig over the top of the non-ambulatory pig.¹¹⁵ The ambulatory pig began running, trampling the non-ambulatory pig.¹¹⁶ FSIS suspended the establishment, but the next day held the suspension in abeyance, allowing the establishment to resume operations.¹¹⁷

Just 16 days later, at the same establishment, a worker put a knock hole in a NAD pig's head and loaded the pig—bleeding and fully conscious—into a cart without the FSIS inspector noticing.¹¹⁸ The worker then wheeled the disabled pig to another pen, where another worker

shackled the pig's leg and began to drag the conscious pig to the hanging area.¹¹⁹ At this point the inspector intervened, rescuing the pig, which was still rhythmically breathing and blinking her eyes, and ensured the pig was euthanized.¹²⁰ The inspector then allowed the pig to be shackled, hung, and processed for human consumption.¹²¹ FSIS reinstated its suspension of the plant, but held it in abeyance two working days later, allowing slaughter operations to resume.¹²²

The Agency knows that cruelty to downed pigs is at least as severe a problem as cruelty to NAD calves. An email from Dr. Keith Gilmore to Daniel Engeljohn, Mary Porretta, et al., notes that when Dr. Gilmore pulled a year's worth of NAD Noncompliance Reports, he found 18 instances of illegal cruelty to NAD pigs and only 1 instance of cruelty to an NAD calf. He noted that "[a]lthough the market hog category has the highest number of animals slaughtered ... they also have a disproportionate number of NR's for inhumane treatment of downer animals."¹²³

VI. Argument

FSIS should prohibit the slaughter of NAD pigs to improve compliance with its food safety and humane handling mandates. FSIS is statutorily required to ensure that adulterated meat is not sold, and that animals are slaughtered in accordance with the HMSA.

Furthermore, FSIS' current policy is arbitrary because: 1) there is no valid reasons for treating NAD pigs differently from NAD mature cattle and veal calves; and 2) it is inconsistent with other USDA policies (e.g., AMS's ban on the slaughter of nonambulatory pigs). "A long line of precedent has established that an agency action is arbitrary when the agency offer[s] insufficient reasons for treating similar situations differently."¹²⁴

For precisely the same reasons that FSIS requires immediate euthanasia of cattle, it must promulgate a similar requirement for NAD pigs. This reform would reduce the risk of meat contamination, end the uncertainty about how to deal with NAD pigs, improve the efficiency of the inspection process, and decrease the multiple incentives for inhumane treatment of animals on farms, during transport, and at slaughter.

FSIS should therefore require that all NAD pigs be condemned and promptly euthanized.

A. FSIS Should Prohibit the Slaughter of NAD Pigs to Fulfill its Food Safety Mandate

FSIS amended 9 CFR 309.3(e) to prohibit the slaughter of NAD mature cattle, in part, "to ensure that animals that may be unfit for human food do not proceed to slaughter and to improve the effectiveness and efficiency of the inspection system."¹²⁵ FSIS has also agreed to amend 9 CFR 309.13(b) to require the prompt euthanasia of NAD veal calves to "improve the Agency's inspection efficiency by eliminating the time that FSIS inspection personnel spend assessing and

¹²⁵ 74 Fed. Reg. 11463.

supervising the treatment of NAD veal calves.”¹²⁶ Because more downed pigs are slaughtered annually than downed cattle were slaughtered at the time of the ban, a requirement that NAD pigs be condemned would achieve even greater food safety and animal handling goals.

A prohibition on slaughtering NAD pigs would ensure that animals unfit for human food do not proceed to slaughter. The studies outlined above show that NAD pigs are disproportionately likely to harbor H1N1 swine influenza, *Campylobacter*, *Salmonella* spp., *Y. enterocolitica*, and other dangerous pathogens. And as would be expected, “[l]ive animals that carry *Salmonella* spp. are 3–4 times more likely to end up as a positive carcass than *Salmonella*-free animals.”¹²⁷

B. FSIS Should Prohibit the Slaughter of NAD Pigs to Improve Efficiency.

As with the rule banning the slaughter of NAD adult cattle and coming rule to do the same for calves, a uniform rule would end the current uncertainty about how to deal with NAD pigs that may harbor such latent severe illnesses. FSIS required that all NAD mature cattle be promptly euthanized in part to “reduce uncertainty in determining the proper disposition of non-ambulatory cattle,”¹²⁸ and it used the same reasoning in granting the petition to do the same for calves.¹²⁹ Similarly, a requirement that all NAD pigs be promptly euthanized would reduce the uncertainty of FSIS inspectors and slaughter establishments confronted with lame pigs that may harbor various pathogens, including porcine spongiform encephalopathy.¹³⁰ Current regulations foster uncertainty because they require FSIS inspectors to make a quick visual diagnosis of whether a non-ambulatory pig is diseased. Yet, as former FSIS senior staff veterinarian Linda Detwiler notes, the cause of a non-ambulatory condition “may be impossible to ascertain.”¹³¹

Additionally, a prohibition on slaughtering NAD pigs would improve the effectiveness and efficiency of the inspection system. FSIS noted that prohibiting the slaughter of NAD cattle meant that inspectors would not need to “spend [time] determining whether or not an animal can be tagged as ‘U.S. Suspect,’ proceed to slaughter, and then re-inspected after slaughter, thereby increasing the time inspection program personnel can focus on other inspection activities.”¹³² Current regulations similarly force FSIS inspectors to spend time monitoring incoming shipments for NAD pigs, deciding whether to tag them as “U.S. Suspect,” and “rigorously” re-inspecting them after slaughter; and according to USDA’s letter to Farm Sanctuary, animals are not allowed to be slaughtered “until the animal has received addition inspection by a FSIS veterinarian.”¹³³ This is time not spent on FSIS’ priorities of monitoring humane handling and slaughter, and preventing meat contamination.¹³⁴ This lost efficiency will become even more important if USDA develops new food safety rules that emphasize moving FSIS inspectors to the

end of the line at pig slaughter establishments.¹³⁵ It is important that the inspectors remaining on ante-mortem inspection duty can focus their time on humane handling enforcement, rather than on the time-consuming process of supervising NAD pigs.

C. FSIS Should Require the Prompt Euthanasia of NAD Pigs to Fulfill its Humane Handling Mandate

HMSA requires “handling of livestock in connection with slaughter . . . be carried out only by humane methods.”¹³⁶ It directs USDA “to designate methods . . . of handling in connection with slaughter which, with respect to each species of livestock, conform to [this] policy.” Congress intended to “establish as a national policy that livestock should be slaughtered and handled in connection with slaughter only by the ‘most humane practicable methods.’”¹³⁷ In 2002, Congress further directed USDA to consider “regulations to provide for the humane treatment, handling and disposition of non-ambulatory livestock.”¹³⁸ FSIS has already prohibited the slaughter of NAD cattle because “humane handling requires that such cattle be promptly euthanized,”¹³⁹ and it has used similar reasoning in agreeing to extend the ban to calves.¹⁴⁰

The current policy fails to ensure the “humane treatment, handling, and disposition” of NAD pigs for at least five independent reasons. First, it creates an incentive for slaughter establishments to inhumanely force NAD pigs to rise. FSIS has acknowledged that allowing the slaughter of NAD cattle “may have created an incentive for establishments to inhumanely force these animals to rise.”¹⁴¹ Similarly, allowing the slaughter of NAD pigs creates an incentive for establishments to force NAD pigs to rise because NAD pigs that rise are worth \$88 to \$126 more per pig than NAD pigs that do not, while saving the establishment labor, segregation, and disposal costs.¹⁴² This encourages establishments to excessively shock, prod, kick, shunt, and drag NAD pigs to force them to rise, in violation of FSIS regulations and the FMIA.¹⁴³ As FSIS has recognized for mature cattle and veal calves, the only way to end this incentive to inhumanely force NAD pigs to rise is to require their prompt euthanasia.

Second, the current policy allows establishments to inhumanely hold suffering sick and injured pigs. NAD pigs are routinely held for hours to see if they will rise, or until the shift ends so they can be slaughtered separately. During this period they are typically held without veterinary care, analgesics, or food. This “[w]aiting can prolong a disabled animal’s suffering,”¹⁴⁴ in clear violation of federal law.¹⁴⁵ And as Dr. Gilmore discovered, NAD pigs

¹⁴⁵ See, e.g., 7 U.S.C. 1902.

suffer not just from this clear violation of the Humane Slaughter Act; they also suffer disproportionately from inhumane treatment so severe that it leads to NRs.¹⁴⁶

Third, the current policy creates an incentive for producers to hold animals even if they are sick or injured, and then to send these weakened animals to slaughter, rather than euthanizing them on the farm. In banning the slaughter of NAD cattle, FSIS noted the prior policy “may have encouraged . . . livestock producers to hold ill or injured cattle from slaughter longer,” which “increases the chances that they will go down and then be subjected to conditions that are inhumane.”¹⁴⁷ The Agency reasoned similarly with regard to NAD calves, stating that “the provision that allows veal calves to be set aside to be warmed or rested may create an incentive for establishments to inhumanely force non-ambulatory veal calves to rise and for veal calf producers to send weakened calves to slaughter.”¹⁴⁸ Similarly, the current policy encourages pig producers to hold breeding pigs, especially breeding sows, for longer before sending them to slaughter in weakened condition. Dr. Temple Grandin notes that this concern is not hypothetical. Indeed, pig producers already allow “old, weak, emaciated sows . . . to deteriorate into a weakened condition . . . likely to become downers.”¹⁴⁹

Fourth, the current policy contradicts the judgment of another branch of USDA, AMS, about humane treatment. AMS prohibits purchasing meat from NAD pigs “to ensure the humane treatment of animals by their being managed and handled in a manner that would enable them to walk into the facility’s stunning area.”¹⁵⁰ Thus a branch of USDA has recognized that slaughtering NAD pigs is inconsistent with humane treatment. FSIS’ current policy is therefore arbitrary because it treats the same situation (NAD pigs) differently from AMS without justification.¹⁵¹

Fifth, the current policy creates an incentive to inhumanely transport and handle pigs. The American Meat Institute cites data showing that 34% of pigs became “fatigued” when subject to “aggressive handling with hot shots,” while just 2% did when subject to “gentle handling with paddles.”¹⁵² The National Pork Board transport manual shows that more than twice as many pigs become “fatigued” when they are transported at freezing temperatures.¹⁵³ And several recent studies have linked pigs becoming non-ambulatory to over-crowding in transport,¹⁵⁴ excessive waiting times at slaughter establishments,¹⁵⁵ and inhumane handling.¹⁵⁶

A requirement that establishments promptly euthanize NAD pigs would encourage reform in all five of these areas because NAD pigs would become worthless. It would thus encourage improved handling for all pigs.

D. FSIS Cannot Distinguish the Slaughter of NAD Pigs from the Slaughter of NAD Cattle and Calves

FSIS has found that requiring the prompt euthanasia of NAD mature cattle and veal calves improves compliance with HMSA and FMIA, both because it decreases cruelty directly and because it makes it easier for inspectors to do their jobs, thus increasing compliance with all aspects of their oversight responsibilities.¹⁵⁷ FSIS must therefore require the prompt euthanasia of NAD pigs too, unless it can show valid reasons to “treat [these] like cases differently.”¹⁵⁸ The agency cannot do so.

1. A Prompt Euthanasia Requirement Would Improve Humane Handling

Given that FSIS has found that HMSA requires the prompt euthanasia of NAD cattle and calves,¹⁵⁹ it must find HMSA requires the prompt euthanasia of NAD pigs, unless it can provide sufficient reasons for treating these similar situations differently.¹⁶⁰ The pork industry has attempted to distinguish NAD pigs from other NAD livestock by labeling them “fatigued.”¹⁶¹ FSIS adopted this distinction in its response to Farm Sanctuary’s petition, distinguishing NAD cattle on the basis that they become non-ambulatory because dairy producers send to slaughter “weakened cattle,” more likely to “go down and then be subject to inhumane conditions.”¹⁶² The response distinguished NAD calves on the basis that they become non-ambulatory due to “veal production practices customary in the United States,” which render calves so debilitated that “further handling necessary for slaughter would be inhumane.”¹⁶³ By contrast, the response asserts, “Because healthy pigs may go down at slaughter because of a temporary metabolic condition, which is unrelated to on-farm practices, prohibiting the slaughter of non-ambulatory pigs at slaughter is unlikely to improve practices prior to slaughter or affect humane handling at slaughter.”¹⁶⁴

This distinction does not survive scrutiny: Pigs become non-ambulatory for reasons effectively identical to those that afflict mature cattle and calves: producers sending weakened breeding sows to slaughter and using customary production practices that debilitate pigs. Dr. Temple Grandin notes: “The industry needs to fix problems with downed, fatigued market-weight pigs. *It is a problem that can be solved and the corrections must be made at the farms.*”¹⁶⁵ Just as dairy producers hold cattle until they become weak, pork producers hold breeding sows to produce extra litters until they become “old, weak, emaciated sows . . . [that] deteriorate into a

¹⁶³ *Id.*

¹⁶⁴ *Id.* at 3.

¹⁶⁵ Attachment 56 (emphasis added).

weakened condition . . . likely to become downers.”¹⁶⁶ And just as veal producers’ production practices debilitate calves, pork producers’ production practices debilitate pigs, especially the practices of breeding “lean hybrid pigs [with] terrible leg conformation,” “rough handling and electric prod use,” and the “indiscriminant use of Paylean.”¹⁶⁷

Like mature cattle and calves, pigs also become non-ambulatory due to inhumane handling and poorly aligned incentives for slaughter establishments. The American Meat Institute animal handling audit counts the “[n]umber of non-ambulatory pigs on the trailer” as evidence of poor handling,¹⁶⁸ as does the pork industry’s Transport Quality Assurance program.¹⁶⁹ Dr. Grandin documents that pork production plants with the right incentives have reduced the number of “fatigued” pigs from 10-20 per hour to one per hour by improving pig genetics and handling, and reducing the use of ractopamine.¹⁷⁰ If “fatigued” pigs were experiencing a “temporary metabolic condition . . . unrelated to on-farm practices,” plants could not reduce their numbers by 90-95% by altering these on-farm and on-plant practices.

Indeed, the American Veterinary Medical Association (AVMA) rejects the industry’s claim that NAD pigs are experiencing a “temporary metabolic condition . . . unrelated to on-farm practices.” In its new Draft Guidelines on the Humane Slaughter of Animals, AVMA focuses on on-farm factors in its section on preventing NAD pigs.¹⁷¹ AVMA notes that breeding pigs for rapid growth, and overfeeding gilts, causes degenerative joint disorders and neurological disorders affecting the spinal cord.¹⁷² It finds that feeding pigs “[h]igh doses of the beta-agonist ractopamine may contribute to downers.”¹⁷³ It notes that “pigs need exercise to increase muscular strength and to develop proper agility” – something that most producers deny breeding sows through the use of gestation and farrowing crates.¹⁷⁴ And AVMA observes that producers’ use of concrete slatted floors, instead of solid floor with soft bedding, causes pigs to develop foot and leg problems that make them vulnerable to collapsing at slaughter.¹⁷⁵

Moreover, once pigs become non-ambulatory, they are vulnerable to inhumane handling regardless of the cause of their disability. FSIS found that allowing the slaughter of cattle non-ambulatory for any reason “created an incentive for establishments to inhumanely force these animals to rise.”¹⁷⁶ And FSIS has specifically found that allowing the slaughter of calves “non-ambulatory because they are *tired* or cold” created incentives to inhumanely handle these animals.¹⁷⁷ Similarly, allowing the slaughter of NAD pigs, regardless of whether they are non-ambulatory due to disease or fatigue, creates an incentive for slaughter establishments to inhumanely force them to rise, and for producers to send weakened sows to slaughter.

¹⁷⁷ Attachment 1 at 1 (emphasis added).

2. A Prompt Euthanasia Requirement for NAD Pigs Would Improve Food Safety

A prohibition on the slaughter of NAD pigs would reduce food safety risks and improve FSIS inspection efficiency. NPPC argues that a ban on the slaughter of NAD livestock is unnecessary because the current case-by-case inspections work.¹⁷⁸ FSIS adopted this argument in its response to the Farm Sanctuary petition, arguing, “FSIS veterinarians are trained to recognize animal diseases that require condemnation” and conduct “rigorous post-mortem inspection” on all NAD livestock carcasses.¹⁷⁹

But FSIS has previously rejected an identical argument by industry. Before Hallmark/Westland, the industry argued that “prohibiting the slaughter of all non-ambulatory cattle for human food is overly broad and not necessary to protect the public.”¹⁸⁰ The industry reasoned that “veterinarians are able to readily discern through ante-mortem or post-mortem inspection whether an animal has suffered an acute injury or is affected with a pathological condition.”¹⁸¹ But FSIS soundly rejected that claim, finding that “the underlying reason for an animal’s non-ambulatory condition cannot always be accurately ascertained when these animals are presented for slaughter.”¹⁸² FSIS also found that post-mortem inspections could not compensate for slaughtering cattle at heightened risk of infection.¹⁸³ FSIS later explained, “The events at the Hallmark/Westland establishment demonstrate that FSIS inspection personnel are not always notified when cattle become non-ambulatory disabled after they pass ante-mortem inspection.”¹⁸⁴ Similarly, FSIS noted that its case-by-case approach to NAD calves created “potential uncertainty in determining the disposition of calves that have been set aside.”¹⁸⁵ And FSIS explained that requiring the euthanasia of NAD calves “would improve the Agency’s inspection efficiency” since case-by-case inspections of NAD livestock are time-consuming.¹⁸⁶ Because FSIS has already determined that a case-by-case approach to NAD cattle and calves hurts food safety and inspection efficiency: first, to refuse to promulgate a similar regulation for pigs would violate FSIS’s statutory mandates regarding both food safety and humane slaughter; and second, it would be arbitrarily and capricious to attempt to assert that a case-by-case approach is effective for NAD pigs, but not for cattle.¹⁸⁷

3. The myth of the “fatigued” pig.

The pork industry argues that most NAD pigs are merely “fatigued,” and that they will recover if given a period to rest,¹⁸⁸ and the industry defines “fatigued” pigs as all NAD pigs that lack “*obvious* injury, trauma, or disease.”¹⁸⁹ First, there is no scientific basis offered by the industry to assert that these pigs are “fatigued,” rather than suffering from non-obvious injuries,

¹⁷⁸ See Attachment 43.

¹⁷⁹ Attachment 49 at 3.

¹⁸⁰ 72 Fed. Reg. 38702.

¹⁸⁷ See *Airmark Corp.*, 758 F.2d at 691 (“Deference to agency authority or expertise . . . ‘is not a license to . . . treat like cases differently.’”).

¹⁸⁸ See, e.g., Attachment 43.

¹⁸⁹ Attachment 43 (Comments of the National Pork Producers Council) (“Fatigued hogs are ones that without *obvious* injury, trauma or disease fall behind contemporaries or refuse to take multiple steps at any stage of the marketing process from loading at the farm to stunning at the plant”) (emphasis added).

traumas, or diseases. Second, the issues that point toward the statutory necessity of immediate euthanasia for NAD pigs apply regardless of whether the pigs might eventually rise.

As discussed above: First, any additional time spent in lairage increases food safety concerns; just two hours in lairage causes 80 percent of animals to become infected—in controlled conditions, where all animals are healthy and ambulatory. As long as pigs can be held for indefinite amounts of time, industry has an incentive to do so, increasing food safety concerns where pigs might rise after 1, 2, 4, 8, or even 24 hours¹⁹⁰; so FSIS’ food safety mandate requires that no distinction be made between pigs who may or may not eventually rise.

Second, multiple studies have shown that cruel treatment is the cause of the vast majority of NAD pigs, including those the industry calls “fatigued.” The meat industries own studies confirm precisely this point, as discussed more thoroughly above: As just one example, the American Meat Institute shows an increase in “fatigue” of 1700 percent when comparing gentle with aggressive handling.¹⁹¹ So FSIS’ humane handling mandate requires that the agency ban the slaughter of even pigs who might eventually rise. Additionally, pigs who are too sick or ill or “fatigued” to walk off of transport trucks are an inherent humane handling issue; as Dr. Grandin has noted, “[m]aintaining an adequate level of animal welfare at the plant level is impossible if the pigs are too weak to walk through the yards.”¹⁹²

Finally, the 500,000 pigs who arrive at slaughter every year unable to walk off the backs of the transport truck require much more oversight time from FSIS inspectors than did the far fewer cattle and calves who arrived non-ambulatory; whether the pigs will or will not eventually rise, inspectors have to spend far more time “determining whether or not an animal can be tagged as ‘U.S. Suspect,’ proceed to slaughter, and then re-inspected after slaughter”¹⁹³ than they did for adult cattle and calves. A ban on the slaughter of NAD pigs will free up much more inspector time than did the NAD cattle ban, “thereby increasing the time inspection program personnel can focus on other inspection activities.”¹⁹⁴

E. The Economic Impact on Industry is No More Relevant for NAD Pigs than It Was for NAD Cattle.

In response to industry concerns about the impact of the NAD cattle ban on industry profits and on the condemnation of cattle who were not adulterated, USDA’s response was that it did not matter.¹⁹⁵ Similarly here, a ban on the slaughter of NAD pigs would have identical positive statutory and regulatory impacts as the NAD cattle and impending NAD calf slaughter bans, and so the economic impact should not be a consideration.

¹⁹⁰ 9 C.F.R. § 313.1(c).

¹⁹¹ Attachment 7 at Slide 15.

¹⁹¹ Attachment 43.

than half of the percentage of cattle that

¹⁹³ 2009 Final Rule, 74 Fed. Reg. at 11463.

¹⁹⁴ *Id.*

That said, it is worth noting that the economic impact of requiring the humane euthanasia of NAD pigs would be less than the impact of the NAD cattle ban. Fewer than one in 200 (0.44%) pigs becomes non-ambulatory, according to the National Pork Producers Council (NPPC).¹⁹⁶ Twice that percentage of cattle become non-ambulatory,¹⁹⁷ yet FSIS found that the cost of a complete ban on the slaughter of NAD cattle was “insignificant compared to the value of their annual production of about \$8.4 billion.”¹⁹⁸ Pig slaughter establishments would face even smaller costs because proportionately half as many pigs as cattle become non-ambulatory. “Comparing the cost to the annual revenue of the meat slaughtering industry alone, which is about \$67.2 billion, the costs of this rule to the industry would not be significant.”¹⁹⁹

Notably the industry’s estimates of lost saleable pork are not credible. In the course of just two years, from 2009 to 2011, NPPC increased its estimate of the amount of pork derived from NAD pigs from 41 million pounds to 66 million pounds,²⁰⁰ even as it reduced its estimate of the number of NAD pigs from 0.8-1% of pigs to just 0.44% – a logical impossibility.²⁰¹ The 66 million pounds figure is particularly suspect. NPPC never explained the methodology behind this figure, but a simple calculation reveals that it relies on strained assumptions. Using NPPC’s data, there are roughly 500,000 NAD pigs.²⁰² Even if each NAD pig weighs 250 pounds, and can thus yield 144 pounds of retail cuts,²⁰³ 66 million pounds of “wholesome pork” would only be lost if fully 92% of NAD pigs are currently processed into “wholesome pork.”²⁰⁴ Yet NPPC provides no data to support this assumption – on the contrary, it concedes that at least 12% of NAD pigs have an “obvious injury, trauma or disease.”²⁰⁵

¹⁹⁶ Attachment 43.

¹⁹⁷ *Id.* (“[T]he overall percentage of hogs that become non-ambulatory [is] less” ¹⁹⁷ Attachment 8, Temple Grandin, *Fixing the Downer Pig Problem*, Meat and Poultry at 82 (May 2006).

¹⁹⁷ *Id.*

do.”)

¹⁹⁸ 74 Fed. Reg. 11465.

¹⁹⁹ 77 Fed. Reg. 15978 (justifying cost of change in meat inspection regime by comparison to \$67.2 billion annual revenue of the meat slaughtering industry).

²⁰⁰ Compare Attachment 50, Comments of Dr. Jennifer Greiner, National Pork Producers Council, on CNN (Dec. 8, 2009), available at <http://transcripts.cnn.com/transcripts/0912/08/cnr.07.html> (“We estimate that if all non-ambulatory pigs were—were banned, all fatigued pigs were banned from the food supply, we would approximately lose 41 million pounds of safe pork going into the food supply”) with Attachment 43, Comments of the National Pork Producers Council, signed by Doug Wolf (Apr. 8, 2011) (“Banning the slaughter of non-ambulatory hogs, however, would not only eliminate approximately 66 million pounds of safe and wholesome pork . . .”).

²⁰¹ Compare Attachment 51, Written Testimony of the National Pork Producers Council, U.S. House Committee on Agriculture Subcommittee on Livestock, Dairy, and Poultry (Apr. 23, 2009), available at <http://democrats.agriculture.house.gov/testimony/111/h042209/Appell.doc> (“data from FSIS show that 0.8 to 1 percent of the roughly 110 million hogs marketed in the U.S. each year become non-ambulatory from fatigue or injury during transport or shortly after unloading”) with Attachment 43, Comments of the National Pork Producers Council, signed by Doug Wolf (Apr. 8, 2011) (citing statistic that 0.44% of pigs are non-ambulatory).

²⁰² Attachment 43.

²⁰³ These are both generous assumptions, based on the average weight of a healthy pig at slaughter and in retail cuts, even though NAD pigs often weigh less than healthy pigs, and more retail cut weight is lost in trimming diseased portions of the carcass. See Attachment 52, Oklahoma Dept. of Agriculture, Food, and Forestry, Average Hog Weight Data, available at <http://www.oda.state.ok.us/food/fs-hogweight.pdf>.

²⁰⁴ 66 million pounds divided by 144 pounds of marketable pork per pig equals 458,333 pigs. That is 92% of the total number of NAD pigs (500,000, according to NPPC). See Attachment 43.

²⁰⁵ NPPC defines “fatigued” pigs as all NAD pigs “without obvious injury, trauma, or disease.” It estimates that 0.37% of pigs are “fatigued” and 0.05% are “injured,” implying that “injured” pigs do have obvious injuries, traumas, or diseases (since there is no third category of NAD pigs). 0.05% is 12% of the combined 0.42% of pigs that are non-ambulatory. Attachment 43.

And even the 66 million pounds figure pales in comparison to the potential losses if the slaughter of NAD pigs causes the American public and American trade partners to lose trust in the safety of American pork. Following the 2008 Hallmark/Westland NAD cattle investigation, USDA recalled 143 million pounds of meat.²⁰⁶ Following the BSE cow scare, exacerbated by the slaughter of NAD cattle, FSIS published rules on specified risk materials that NPPC and other industry groups claimed would waste 400 million pounds of meat.²⁰⁷ The European Union has already barred the import of American pork from NAD pigs, requiring their immediate euthanasia instead.²⁰⁸ The potential financial losses if the sale of pork from NAD pigs creates a disease scare are dire. Indeed, preventing such losses was a core motivation for Congress in passing FMIA.²⁰⁹

Perhaps most critically, though, the industry could eliminate almost all of these losses by treating animals better. In a meta-analysis of data covering 12,333 trailer loads, amounting to 2,053,945 pigs, researchers found huge variation in rates of NAD pigs leaving different trailers: ranging from 0% to 10.19% of pigs non-ambulatory.²¹⁰ The researchers identified nine factors that meat packers and producers could alter that would have a statistically significant effect on reducing NAD pig numbers.²¹¹ For example, reducing stocking density on transport trucks has the largest effect of any variable on the number of NAD pigs at slaughter.²¹² Other studies have found that establishments can reduce NAD losses by holding pigs for less time in trailers at slaughter establishments and reducing transport times.²¹³

Dr. Temple Grandin notes, “Fatigued pigs are a problem that can be easily corrected.”²¹⁴ She finds that by implementing humane handling reforms, plants can reduce NAD pigs from 10 to 20 per hour of production to one per hour.²¹⁵ In particular, plants can reduce NAD pigs by stopping rough handling, not overcrowding transport trucks, and “[c]ontrolling the indiscriminant use of Paylean.”²¹⁶ Of course, this accentuates the fact that there is no difference between “fatigued” pigs and other NAD pigs, and it accentuates the fact that the pigs the industry calls “fatigued” have been abused, in violation of federal law.

Yet the pork industry has failed to implement these simple reforms. To the contrary, the proportion of pigs that are non-ambulatory at slaughter establishments today is three times higher

²⁰⁶ Attachment 53, David Brown, *USDA Orders Largest Meat Recall in U.S. History*, Washington Post (Feb. 18, 2008), available at <http://www.washingtonpost.com/wp-dyn/content/article/2008/02/17/AR2008021701530.html>.

²⁰⁷ See Attachment 54, Meat Industry Letter on Bovine Spongiform Encephalopathy (Jan. 20, 2008), available at <http://www.nppc.org/2008/01/letter-on-bovine-spongiform-encephalopathy-2/>.

²⁰⁸ See Attachment 55, European Council Regulation (EC) No. 1099/2009, Art. 15, Annex III.1.11 (Sept. 24, 2009) (“Animals which are unable to walk shall not be dragged to the place of slaughter, but shall be killed where they lie.”) Meat imported from any “third country” must be certified to comply with “equivalent” standards. *Id.* Chap. II, Art. 12.

²⁰⁹ See 21 U.S.C. 602 (expressing Congress’ finding that “[u]nwholesome, adulterated, or misbranded meat or meat food products impair the effective regulation of meat and meat food products in interstate or foreign commerce, are injurious to the public welfare, destroy markets for wholesome, not adulterated, and properly labeled and packaged meat and meat food products, and result in sundry losses to livestock producers and processors of meat and meat food products, as well as injury to consumers.”).

²¹⁵ *Id.*

²¹⁶ *Id.* Paylean is Elanco’s brand name of the generic drug ractopamine.

than it was in 1933-34, when 0.16% of pigs were non-ambulatory after transport.²¹⁷ The industry has not implemented these simple reforms because it has little economic incentive to do so. But if FSIS amends its regulations to stop the industry from profiting from the slaughter of NAD pigs, FSIS will create an incentive for the industry to improve handling of all pigs. The industry is capable of reform when guided by the right incentives: for example, in establishments that fined producers just \$20 for each “fatigued” pig, the problem of “fatigued” pigs was “greatly reduced.”²¹⁸ A prohibition would provide an even greater financial incentive for the industry to greatly reduce the number of pigs becoming non-ambulatory.

F. USDA’s Denial of Farm Sanctuary’s Downer Livestock Petition

In March 2013, USDA denied Farm Sanctuary’s petition that asked the agency to require humane euthanasia for all NAD livestock. We have revised our petition in response to the Agency’s findings.

- First, re: adulteration, we hope that in the light of the agency’s own December 2013 salmonella guidance and the information we have provided, USDA will agree that holding animals non-ambulatory in lairage for any period of time is patently out of compliance with food safety requirements, as discussed in the agency’s own guidance.
- Second, re: efficiency of agency operations, we hope the agency will agree that oversight of vastly more pigs than NAD calves or cattle points toward even greater agency efficiency gains from a ban on NAD pigs than were (or will be) attained by the NAD cattle and calf bans.
- Third, re: humane slaughter, the agency suggested based on its review of Farm Sanctuary’s first petition that NAD livestock do not result exclusively from inhumane treatment. As discussed in detail above, industry can eliminate 96-100 percent of NAD pigs by eliminating inhumane treatment and cutting back on ractopamine use, as documented in many studies.²¹⁹ Thus, it is clear that NAD pigs are caused by inhumane treatment. Additionally, USDA’s own analysis documented that NRs for inhumane treatment of downed pigs showed “a disproportionate number of NR’s for inhumane treatment” of NAD pigs over NAD calves,²²⁰ so USDA’s reasoning on behalf of calves will clearly apply even more robustly on behalf of pigs.

VII. Conclusion

Petitioners request that FSIS initiate rulemaking to require the condemnation and prompt euthanasia of NAD pigs. FMIA and its HMSA provision point inexorably to FSIS’s statutory obligations to ensure both that contaminated meat not enter the human food supply and also that animals be humanely handled in connection with slaughter. Acting on this dual mandate, FSIS prohibited the slaughter of NAD cattle “to ensure that animals that may be unfit for human food do not proceed to slaughter and to improve the effectiveness and efficiency of the inspection system.”²²¹ It has promised to do the same for NAD calves, using the same analysis.²²² As

²¹⁷ Nor were 1933-34 unique years: as late as 1951 (the last year data was collected), just 0.18% of pigs arrived non-ambulatory at the Omaha Livestock Market by truck and rail. Attachment 5.

²¹⁸ Attachment 48.

²¹⁹ USDA acknowledges in its letter a differential of 1700 percent between gentle and aggressive handling, and the agency chooses to err on the side of the tiny fraction of pigs (just 6 percent, with 94 percent going down because of inhumane treatment) who went down for reasons other than inhumane treatment. This reasoning is a violation of USDA’s humane handling mandate and cannot be reconciled with its mandate to treat like circumstances alike.

²²⁰ Email from Keith Gilmore to Daniel Engeljohn, Mary Porretta, et al. (December 04, 2012 10:07 PM).

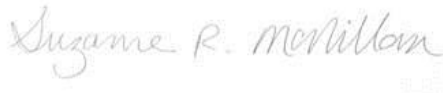

²²¹ 74 Fed. Reg. 11463.

detailed above, the slaughter of NAD pigs poses greater food safety and humane slaughter threats than those addressed by these previous FSIS actions; thus, a prohibition on their slaughter would reduce food safety risks, reduce violation of federal humane slaughter requirements, and free up FSIS inspectors' time to focus on the rest of their food safety and humane slaughter mandate. FSIS should therefore prohibit the slaughter of NAD pigs, and require their prompt euthanasia, to better fulfill its food safety and humane handling mandates.
